

Quick recap

The meeting focused on reviewing the status of the Darwin Core Data Package (DP) guide and related proposals following a public review period. The group discussed scheduling regular monthly meetings, ultimately deciding on the first Monday at 12:30 UTC. They assessed consensus on various term changes and document proposals, with the mineralogy extension requiring additional development work before being ready for public review. The team agreed to release schemas as a release candidate version (RC1) rather than immediate 1.0, and decided to accept responsibility for managing the schemas as part of the Darwin Core standard. John reported being ready to proceed with finalizing documents within a week, and the group noted that executive committee review would be needed before ratification at their April 14th meeting.

Next steps

- John: Check schemas word for word to ensure they reflect all approved changes from public review
- John: Update the conceptual model document and data package guide documents based on feedback received, and generate final public drafts
- John: Make a pull request in the Darwin Core DP repository with changes to the guide and conceptual model
- John: Share links to final public drafts of the documents with the maintenance group for review
- Steven and John: Meet to discuss the term change process
- Ben Norton: Add new mineralogy extension terms to the issue tracker as new term requests
- Ben Norton: Prepare feature report(s) for the mineralogy extension, including justification and implementation experience, prior to public comment
- Peter/GBIF: Move/copy finalized schemas from Darwin Core DP repository to rs.tedwig.org as release candidate 1
- Maintenance Group: Notify Genetic Sequence Consortium about upcoming changes and coordinate timing for remapping
- Steven/Group: Schedule and hold follow-up meeting(s) as needed to review progress and plan next steps
- John: Update the GSC mapping according to the memorandum of understanding (noted as housekeeping in the transcript)
- John/Steven/Group: Update the IPT and rs.gbif.org with new terms/schemas as part of the workflow
- John/Steven/Group: Add new guides to the navigation and repository as part of the workflow
- Steven/John: Prepare materials (drafts, feature/implementation reports) for executive committee review by April 14 meeting
- Ben Norton: Continue edits to the mineralogy extension specification and prepare targeted guide for mineralogists
- Steven/Group: Set up recurring monthly meeting invitation for the group (first Monday 1230 UTC) and communicate to all members

- Steven/John: After executive committee ratification, update metadata on rs.tdwg.org, regenerate all documents, publish new terms/quick reference guide, and link new documents in the menu
- Steven/John: After ratification, update the GSC mapping and IPT as noted above
- Peter/John/Steven: Coordinate pull requests for term changes and new guides in the Darwin Core repository after DP repository updates
- Steven/Group: Communicate meeting notes and additional comments after the next meeting

Summary

Project Status and Meeting Logistics

The team discussed meeting logistics and note-taking processes. Steven requested status updates on various projects including mineralogy extensions rather than detailed explanations, as they need to determine next steps and meeting schedules. The group agreed to establish monthly recurring meetings, though specific days and times were not finalized, with some concerns raised about Monday and Friday availability due to people not being present.

Regular Meeting Time Scheduling

The team discussed scheduling a regular meeting time, ultimately agreeing on Mondays at 12:30 UTC (2:30 Central European Time). They decided to start with the first Monday meeting, which would be around April 6th, rather than waiting longer. The group determined this time would replace the existing Darwin Core Data Package meetings, though Tim clarified that the GBIF internal meetings would continue with a different focus.

Project Progress and Next Steps

The team discussed scheduling adjustments due to an upcoming public holiday in Denmark and Germany on Monday the 6th, which would affect participation from both Jörg and Tim. Steven provided an update on the 30-day public comment period, noting that no new concerns had been raised and that remaining issues had reached consensus. The team outlined their next steps, which include generating a draft section of terms, publishing documents on the dwc.tadwick.org website, and updating metadata on rs.tadwork.org and other systems after executive committee ratification. Ben Norton confirmed the proposal should progress smoothly through the executive committee review.

Term Changes and Consensus Review

The team discussed term changes and document proposals, with Steven noting that most individual term changes had achieved consensus after review and modifications. John observed that there was significant overlap in what was ready for consensus between his review and Steven's initial assessment, with only one item (8.15) requiring further attention. The group confirmed consensus on the individual term proposals without objection and briefly discussed the conceptual model document proposal, which had minimal controversy.

Conceptual Model and Data Package

The group discussed the conceptual model document and data package guide. They agreed there was consensus on the conceptual model document proposal. Regarding the data package guide, they reviewed issue 815 about managing profiles and schemas. John proposed leaving the document as is and publishing schemas in rs.tadwick.org. The group noted 8 upvotes and no negative comments on this proposal, suggesting consensus. They debated whether to

accept responsibility for managing these schemas as part of Darwin Core standards, with Ben Norton suggesting they should decide now if it's possible. The discussion ended with an incomplete thought about rs.tadwick.org.

Darwin Core Schema Publishing Plan

The team discussed publishing Darwin Core data package schemas in the rs.tadwick.org repository. Steven and John proposed including the schemas in their normal workflow similar to how they update IPT schemas. Tim suggested using a version number other than 1.0, potentially starting with 0.1 or RC1 (release candidate 1) to allow for iterations within the Tadwig sphere before reaching version 1.0. Peter supported taking on this responsibility, comparing it to maintaining dist files, and suggested using RC1 for release candidates to allow for testing before final release.

New System Implementation Discussion

The team discussed concerns about implementing a new system, with Ben Norton raising questions about the maintenance group's workload and suggesting a potential biannual or quarterly change cycle. John addressed the challenge of getting people to adopt the system, noting that while some organizations like GBIF might be hesitant to commit early, others at the frontier of innovation would likely test it regardless. The group discussed version numbering, with John suggesting that calling it RC1 might be more convincing than 0.1, and Steven clarified that version 1.0 would be released after the review and ratification process.

Release Candidate Version Numbering Discussion

The team discussed the version numbering for a release candidate, with Steven suggesting release candidate 1.0 would provide more confidence than 0.1. Peter proposed releasing schemas at rs.tdwg.org as release candidate 1, followed by public review and eventual release as 1.0. The group agreed to accept management responsibility for the Darwin Core Data Package Guide, and Steven confirmed there was sufficient support to consider this consensus. They also noted the need to contact the Genetic Sequence Consortium regarding DNA-related terms in the conceptual model.

Darwin Core Mineralogy Extension Progress

The team discussed progress on the mineralogy extension for Darwin Core, including community review feedback and implementation experiences. Ben Norton explained that while Darwin Core DP provides advantages for the geosciences community, there are still decisions needed about how to handle certain aspects like material assertions and measurement facts in Darwin Core Archives. The team determined that a guide will be needed to explain implementation, particularly for mineralogists who are new to data standards. Ben Norton noted that while the specification document exists, it needs editing and will be integrated into MIDs, with the geo namespace being maintained for these terms.

Darwin Core Schema Progress Update

The team discussed progress on Darwin Core schema updates and next steps for public review. John reported that schemas are ready with all changes and a new data package guide has been generated, with full readiness expected within a week. The group agreed to prepare materials for the executive committee meeting on April 14th, though there is a 30-day decision timeframe after submission. Ben Norton raised questions about timing for new mineralogy

extension terms, and the team agreed to add these as issues in the tracker with appropriate tagging for future consideration.
